

Rev 4B Instructions 8/23/2021 Quick Start for MAC and Windows users

Quick Start Basic Image:

If you have received permission to download the "**Basic Image**" and these **instructions** please place in a folder on your computer example **Download==>Raspberry Pi Image**.

Requirements and setup:

Raspberry Pi2, Pi3 or Pi4 computer
32GB MicroSD card Class 10 or better – Use a good quality card.

Network connection for the Pi

Network connection for UDMP or UNVR with Protect 1.18.1 and 1.19.0

HikVision Cameras that work – **Please stop here if you do not have one of these 2 cameras. I have tried others with no luck!**

A. **DS-2DE4A425IW-DE** 4MP 25x PTZ Zoom Darkfighter Auto Tracking IP Camera

B. **DS-2DE3304W-DE** 3MP PTZ 4X Zoom

Network connection to desktop computer MAC in this example below. I will also try to show Windows 10 Tools for this use case.

Your Unifi account access to the UniFi equipment.

All devices must be on the same network, Subnet and VLAN example: UDMP 192.168.1.1 , Pi4B 192.168.1.34 , Hikvision PZT camera: 192.168.1.65

Tools on PC required:

PuTTY to SSH into the Raspberry Pi ==> <https://www.chiark.greenend.org.uk/~sgtatham/putty/>

Raspberry Pi Imager to place "Basic Image" onto a 32GB Micro SD card for your computer ==> https://downloads.raspberrypi.org/imager/imager_latest.exe

Tools on MAC required:

VSSH to SSH into the Raspberry Pi ==> Go to the APPS Store <https://insmac.org/macosx/224-vssh.html>

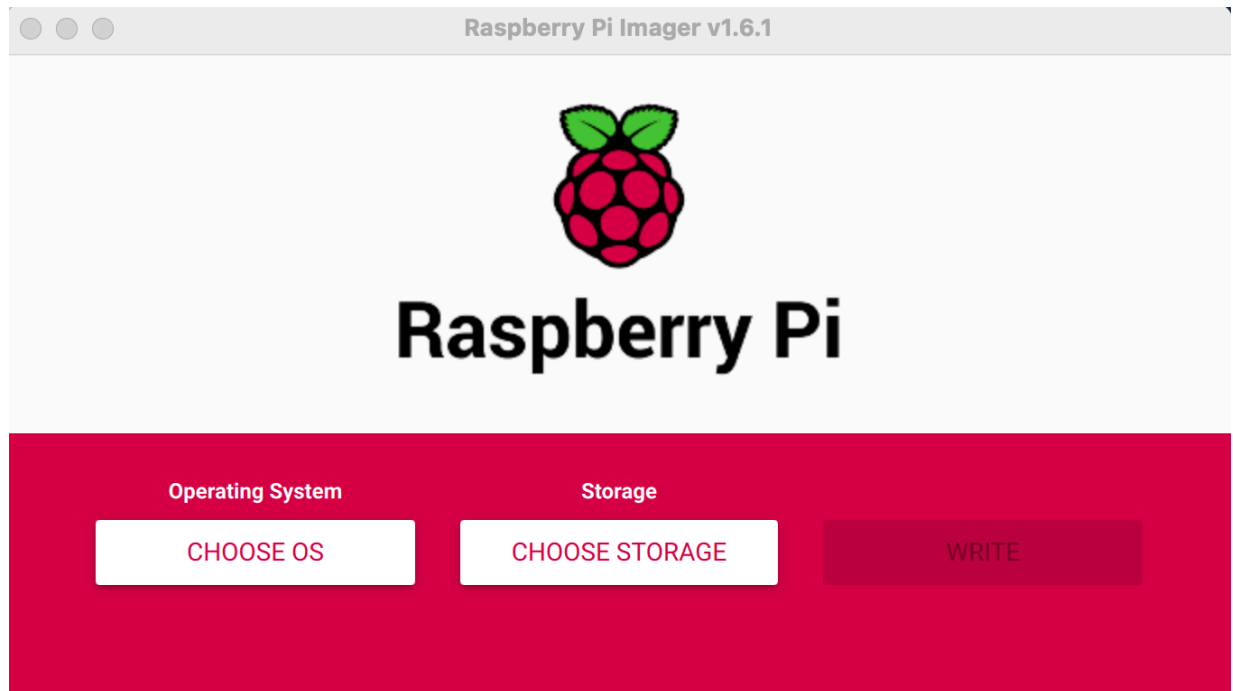

Raspberry Pi Imager to place "Basic Image" onto a 32GB Micro SD card for your computer ==> <https://www.raspberrypi.org/software/>

Unifi-Cam-Proxy program by **Keshav Varma** and all credit goes to the author:

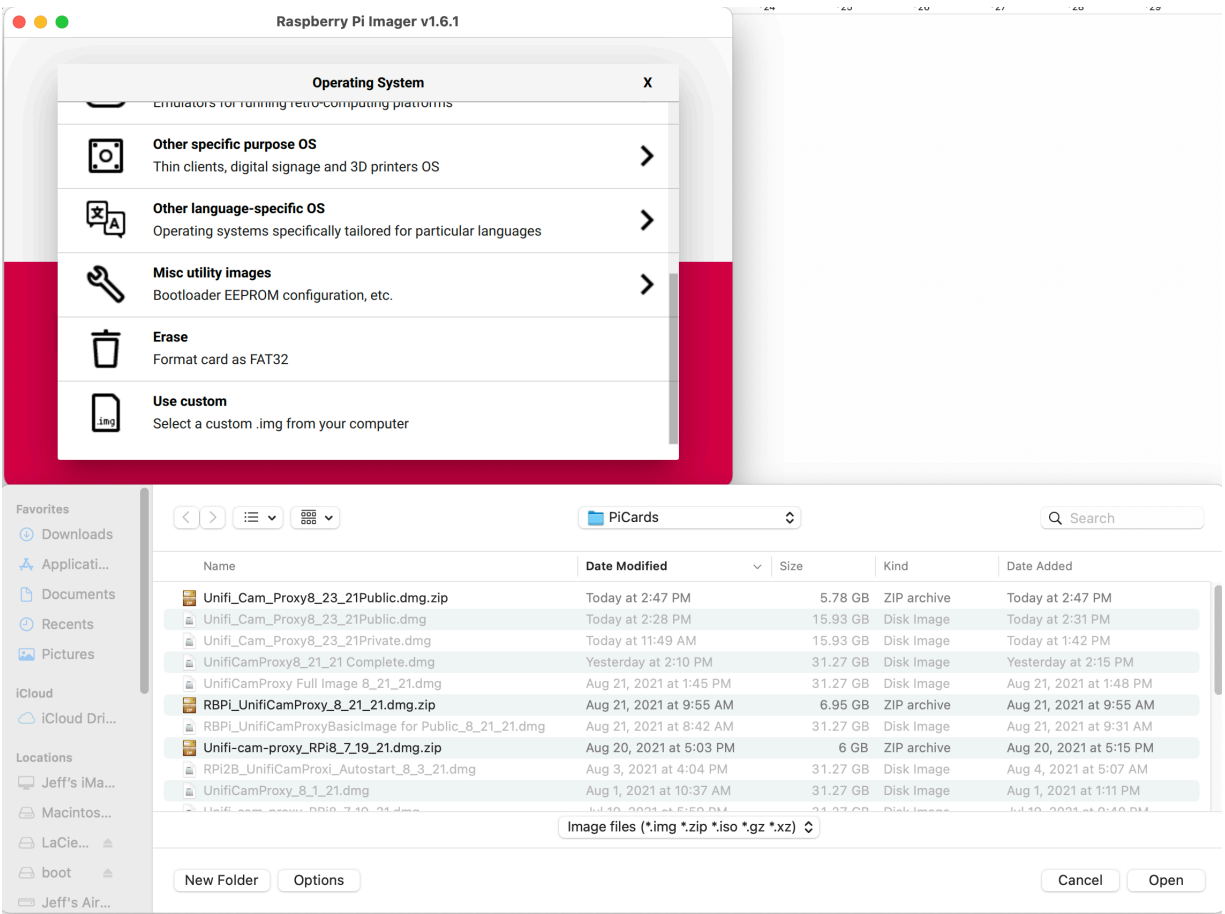

<https://github.com/keshavdv/unifi-cam-proxy>

For Quick Start Basic Image:

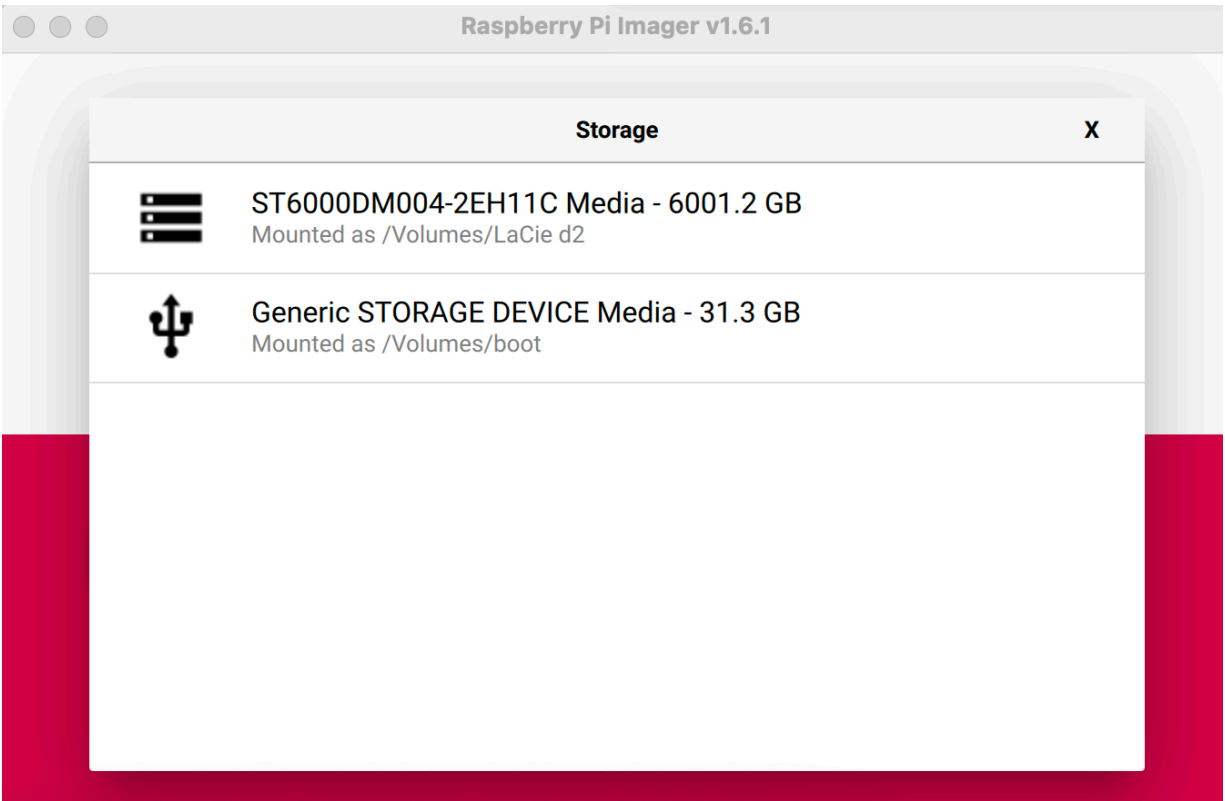

1. Start Raspberry Pi Imager v1.6.1 (or greater)

2. Burn the "Basic Image" provided to you.
 - Click Operating System / Choose O/S
 - Scroll down to "Use custom"
 - Navigate to the folder you downloaded the "Basic Image" name : **Unifi_Cam_Proxy8_23_21Public.dmg.zip**
 - Place your clean new 32GB into the PC/MAC to start image
 -

- Click Storage and choose the 32GB Card

- Click Write / Choose YES / Type your OS password and click OK.

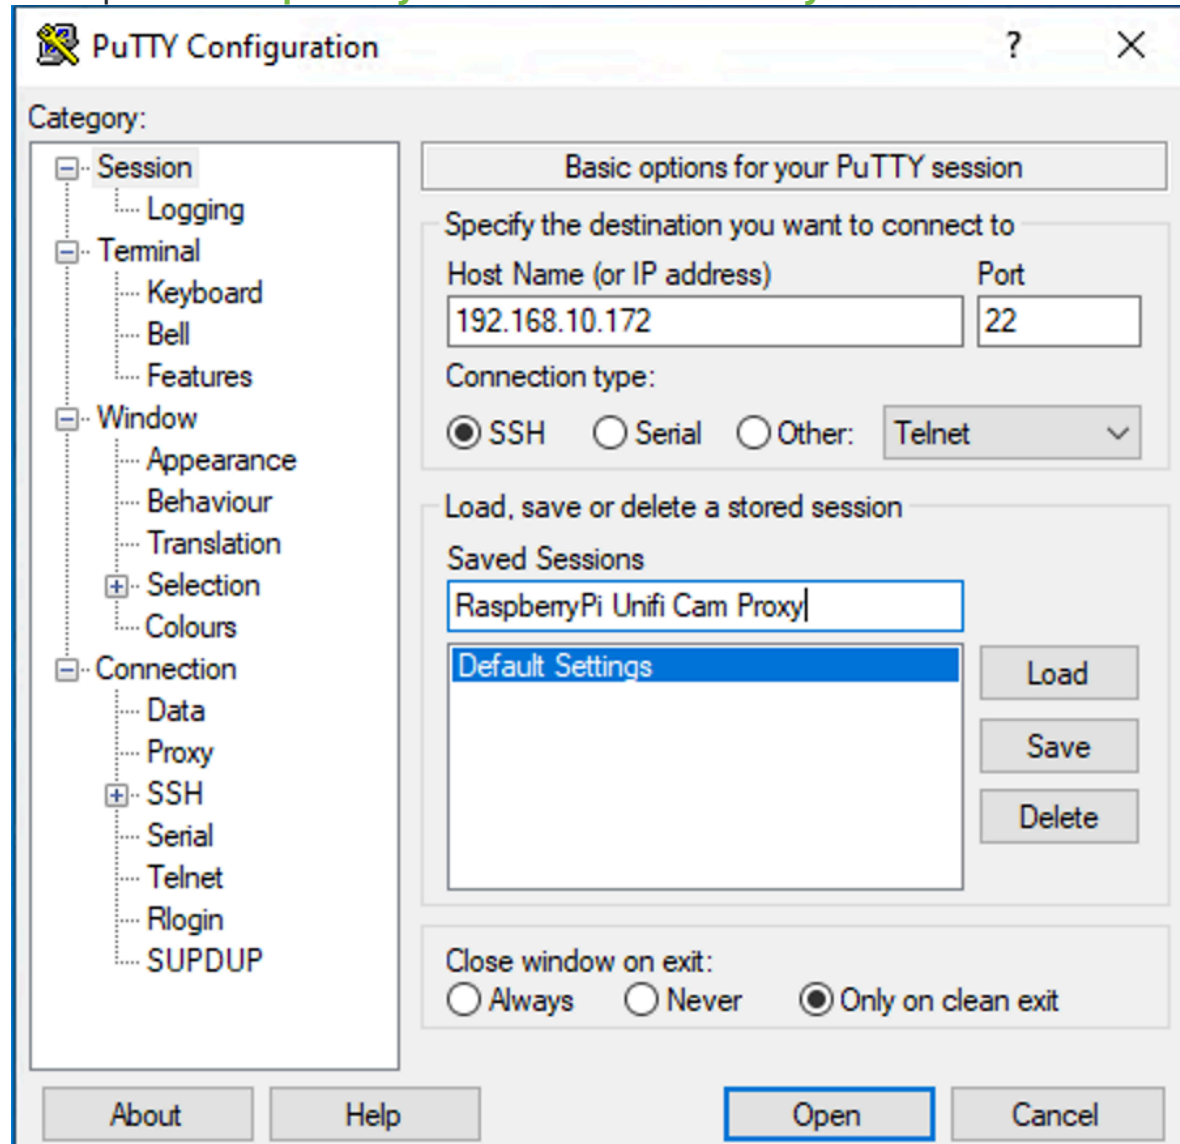

Wait about 20 min to write to the card. Eject card when finished.

3. Place your Basic Image card in to your Raspberry Pi / Connect Network cable / Connect Power / Wait 2 min

- Use utilities like Angry IP Scanner to find your Raspberry Pi IP address for example 192.168.10.172

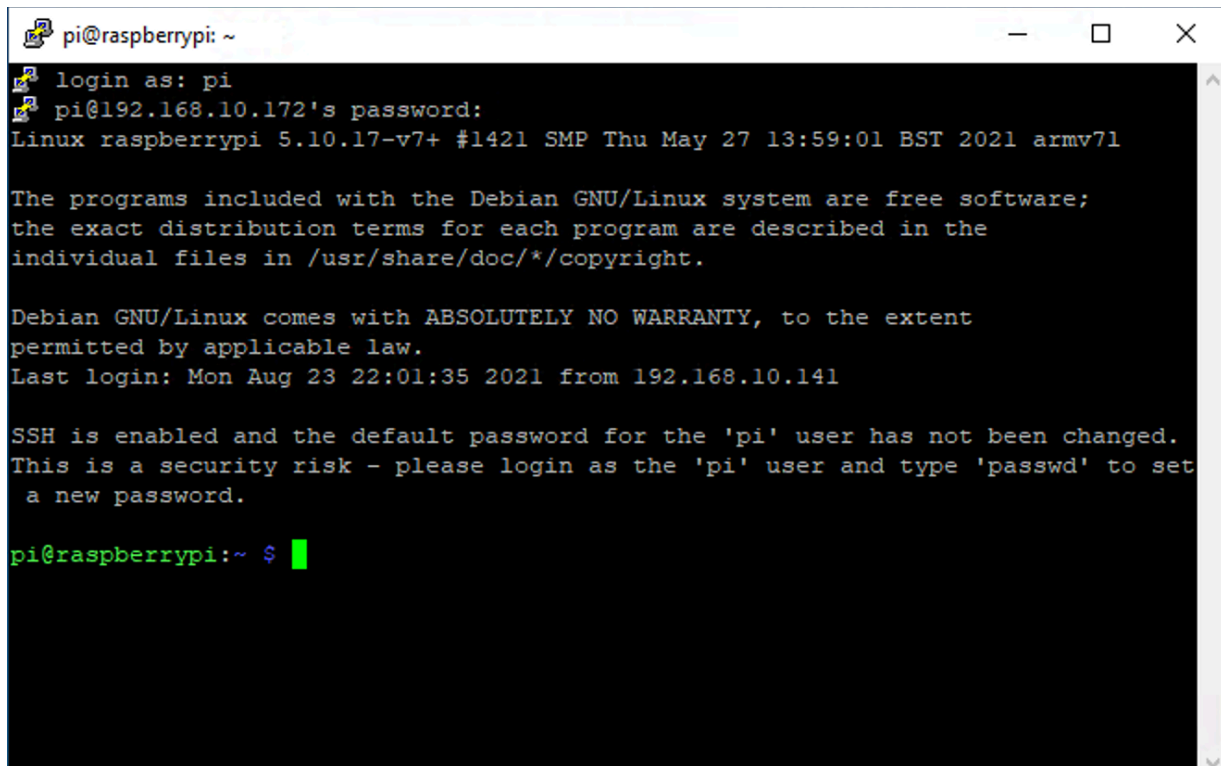

4. Start PuTTY (or vssh on MAC) to SSH into the Raspberry Pi
- Type the RBPi IP address example: 192.168.10.172
 - Name your SSH Session in the "Saved Session Box" example: **RaspberryPi Unifi Cam Proxy** and click SAVE

- Load your PuTTY SSH session by clicking the saved session : RaspberryPi Unifi Cam Proxy
- Click Open
- The session will ask for user: **pi** and Password:

raspberrypi

- Change user and password for security in the future

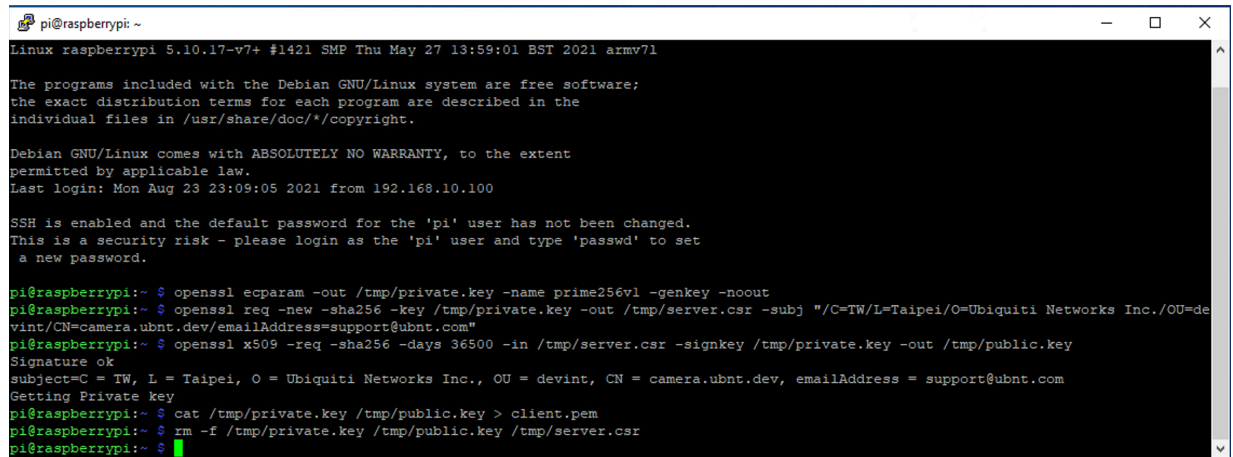

```
pi@raspberrypi: ~  
login as: pi  
pi@192.168.10.172's password:  
Linux raspberrypi 5.10.17-v7+ #1421 SMP Thu May 27 13:59:01 BST 2021 armv7l  
  
The programs included with the Debian GNU/Linux system are free software;  
the exact distribution terms for each program are described in the  
individual files in /usr/share/doc/*/copyright.  
  
Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent  
permitted by applicable law.  
Last login: Mon Aug 23 22:01:35 2021 from 192.168.10.141  
  
SSH is enabled and the default password for the 'pi' user has not been changed.  
This is a security risk - please login as the 'pi' user and type 'passwd' to set  
a new password.  
  
pi@raspberrypi:~ $
```

5. Create your own client certificate via cutting and pasting the following into the pi@raspberrypi: (prompt):

```
openssl ecparam -out /tmp/private.key -name prime256v1  
-genkey -noout  
openssl req -new -sha256 -key /tmp/private.key -out /  
tmp/server.csr -subj "/C=TW/L=Taipei/O=Ubiquiti  
Networks Inc./OU=devint/CN=camera.ubnt.dev/  
emailAddress=support@ubnt.com"  
openssl x509 -req -sha256 -days 36500 -in /tmp/  
server.csr -signkey /tmp/private.key -out /tmp/  
public.key  
cat /tmp/private.key /tmp/public.key > client.pem  
rm -f /tmp/private.key /tmp/public.key /tmp/server.csr
```

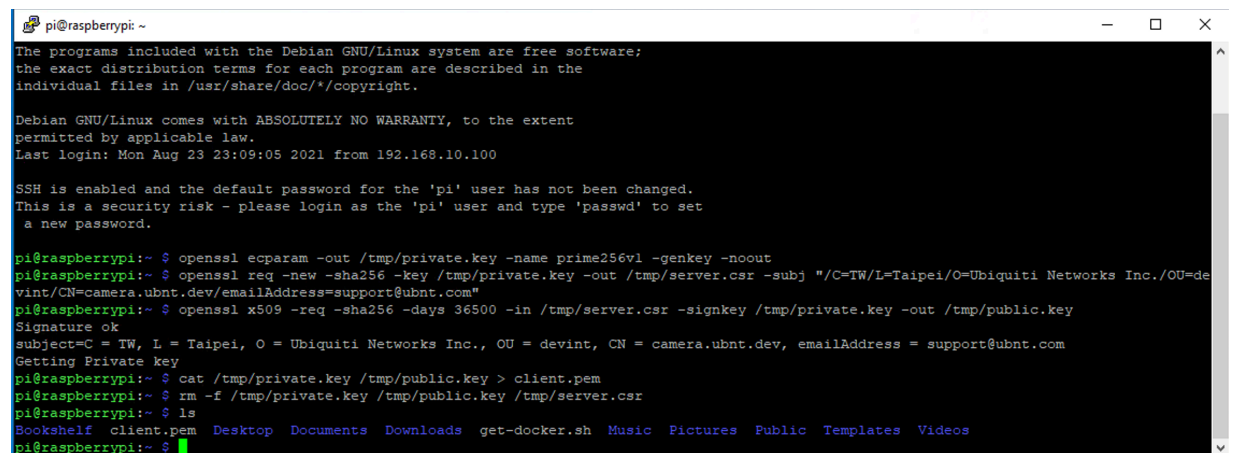

Hit enter and you will see:

```
pi@raspberrypi:~  
Linux raspberrypi 5.10.17-v7+ #1421 SMP Thu May 27 13:59:01 BST 2021 armv7l  
The programs included with the Debian GNU/Linux system are free software;  
the exact distribution terms for each program are described in the  
individual files in /usr/share/doc/*/copyright.  
Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent  
permitted by applicable law.  
Last login: Mon Aug 23 23:09:05 2021 from 192.168.10.100  
SSH is enabled and the default password for the 'pi' user has not been changed.  
This is a security risk - please login as the 'pi' user and type 'passwd' to set  
a new password.  
pi@raspberrypi:~$ openssl ecparam -out /tmp/private.key -name prime256v1 -genkey -noout  
pi@raspberrypi:~$ openssl req -new -sha256 -key /tmp/private.key -out /tmp/server.csr -subj "/C=TW/L=Taipei/O=Ubiquiti Networks Inc./OU=devint/CN=camera.ubnt.dev/emailAddress=support@ubnt.com"  
pi@raspberrypi:~$ openssl x509 -req -sha256 -days 36500 -in /tmp/server.csr -signkey /tmp/private.key -out /tmp/public.key  
Signature ok  
subject=C = TW, L = Taipei, O = Ubiquiti Networks Inc., OU = devint, CN = camera.ubnt.dev, emailAddress = support@ubnt.com  
Getting Private key  
pi@raspberrypi:~$ cat /tmp/private.key /tmp/public.key > client.pem  
pi@raspberrypi:~$ rm -f /tmp/private.key /tmp/public.key /tmp/server.csr  
pi@raspberrypi:~$
```

Your own personal client certificate will be created on the RBPi root called client.pem.

You can view the results by typing **LS** at the prompt. See below.

```
pi@raspberrypi:~  
The programs included with the Debian GNU/Linux system are free software;  
the exact distribution terms for each program are described in the  
individual files in /usr/share/doc/*/copyright.  
Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent  
permitted by applicable law.  
Last login: Mon Aug 23 23:09:05 2021 from 192.168.10.100  
SSH is enabled and the default password for the 'pi' user has not been changed.  
This is a security risk - please login as the 'pi' user and type 'passwd' to set  
a new password.  
pi@raspberrypi:~$ openssl ecparam -out /tmp/private.key -name prime256v1 -genkey -noout  
pi@raspberrypi:~$ openssl req -new -sha256 -key /tmp/private.key -out /tmp/server.csr -subj "/C=TW/L=Taipei/O=Ubiquiti Networks Inc./OU=devint/CN=camera.ubnt.dev/emailAddress=support@ubnt.com"  
pi@raspberrypi:~$ openssl x509 -req -sha256 -days 36500 -in /tmp/server.csr -signkey /tmp/private.key -out /tmp/public.key  
Signature ok  
subject=C = TW, L = Taipei, O = Ubiquiti Networks Inc., OU = devint, CN = camera.ubnt.dev, emailAddress = support@ubnt.com  
Getting Private key  
pi@raspberrypi:~$ cat /tmp/private.key /tmp/public.key > client.pem  
pi@raspberrypi:~$ rm -f /tmp/private.key /tmp/public.key /tmp/server.csr  
pi@raspberrypi:~$ ls  
Bookshelf client.pem Desktop Documents Downloads get-docker.sh Music Pictures Public Templates Videos  
pi@raspberrypi:~$
```

6. Type : **sudo reboot**

- wait about 2 min
- start a new Putty session, log in with user and password.

Test your results to make sure your are ready.

Check Version of Unifi-cam-proxy:

unifi-cam-proxy -version (-minus,minus,version)

Should show 0.1.4 or higher

FFMPEG Version Check if you have problems:

ffmpeg -version (-minus,minus,version)

Should be greater than 4.1.6.1 ==> or something like this:

```

pi@raspberrypi:~$ ffmpeg -version
ffmpeg version 4f87bd4 Copyright (c) 2000-2021 the FFmpeg developers
built with gcc 8 (Raspbian 8.3.0-6+rpi1)
configuration: --extra-cflags=-I/usr/local/include --extra-ldflags=-L/usr/local/lib --extra-libs='-lpthread -lm -latomic' --arch=armel --enable-gmp --enable-gpl --enable-libaom
freetype --enable-libkvaazaar --enable-libmp3lame --enable-libopencore-amrnb --enable-libopencore-amrwb --enable-libopus --enable-librtmp --enable-libsndkit --enable-libsoxr --e
--enable-libx264 --enable-libx265 --enable-libxvid --enable-mmal --enable-nonfree --enable-omx --enable-omx-rpi --enable-version3 --target-os=linux --enable-pthreads --enable-op
libavutil 56. 70.100 / 56. 70.100
libavcodec 58.134.100 / 58.134.100
libavformat 58. 76.100 / 58. 76.100
libavdevice 58. 13.100 / 58. 13.100
libavfilter 7.110.100 / 7.110.100
libswscale 5. 9.100 / 5. 9.100
libswresample 3. 9.100 / 3. 9.100
libpostproc 55. 9.100 / 55. 9.100

```

Test the Big Buck Bunny Video
 Tested on Unifi Protect 1.18.1 and 1.19.0
 on UNVR and UDMP

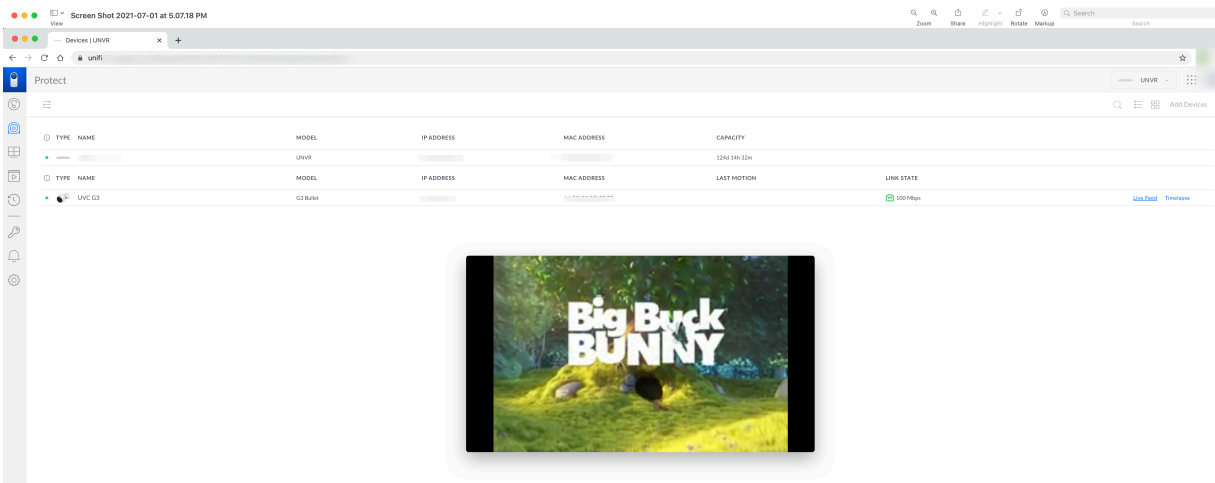

See This:

<https://lindevs.com/install-ffmpeg-on-raspberry-pi/>

192.168.XX.YYY is the IP address of of your UNVR or

UDMP

ABC3f3nAFPX123FISpZmFSJ8XYZKWHoK is your Token
you generated. zsTGLfSbOIX5kIS3yGiedYDQYhXoQ95H
**unifi-cam-proxy --host 192.168.XX.YYY --cert client.pem
--token ABQQQQQQQQQQQQQQQQQQQQQQQQQQK rtsp -s
rtsp://wowzaec2demo.streamlock.net/vod/
mp4:BigBuckBunny_175k.mov**

Make new Token on UDMP: iPabkhlk95zullu02b4E8ka8O9Cb0eJw
Mine on UDMP: **unifi-cam-proxy --host 192.168.10.1 --
cert client.pem --token iPabkhlk95zullu02b4E8ka8O9Cb0eJw
rtsp -s rtsp://wowzaec2demo.streamlock.net/vod/
mp4:BigBuckBunny_175k.mov won't work on UDMP 1.19.0**

Make new Token on UNVR:

VruHE7Zk516ErKaQcuRfDivmHL4TMKuN
Mine on UNVR: **unifi-cam-proxy --host 192.168.10.157 --
cert client.pem --token
VruHE7Zk516ErKaQcuRfDivmHL4TMKuN rtsp -s rtsp://
wowzaec2demo.streamlock.net/vod/
mp4:BigBuckBunny_175k.mov won't work on UDMP 1.19.0**

After this code is running on your Pi4B go to the Unifi Protect under interface

A camera UVC3G with IP address of 192.168.1.10 will be running the Bunny movie. Click Live Feed to see it.

Control+Z to stop the Bunny Video.

You are ready to run your one Unifi Cam Proxy for your camera.

For my Hikvision camera I can run these two types of command lines in the Putty command line prompt:

```
unifi-cam-proxy -H 192.168.10.153 -i 192.168.10.34 -c  
client.pem -t 123zlvnKnAGVe6Ab1XmfDOWE1wDABCD  
hikvision -u admin -p 9Wodda!
```

-or

```
unifi-cam-proxy -H 192.168.10.153 --mac  
4c:f5:dc:4d:7d:24 -i 192.168.10.34 -c client.pem -t  
XXXXXZWzfFJp9WoCtxJh30gFho9qYI hikvision -u admin -p  
XXXXondaA
```

Place your own:

UDMP or UNVR IP address: 192.168.10.153

Camera IP Address: 192.168.10.34

Camera MAC Address: 4c:f5:dc:4d:7d:24

Created

Install Raspberry Pi OS from scratch and unifi-cam-proxy steps:

1. Install clean new RBPi Buster O/S on 32GB card from a MAC or PC.

Go to Youtube link for help: https://www.youtube.com/watch?v=O_0w5EvEmD4

2. Once the image is complete copy the SSH file I provided onto the root directory of the RBPi card.

Just drag and drop in onto the card. Viewing the card directory you will see the SSH file.

This step eliminates steps 4 and 5 below of connecting a keyboard, mouse and monitor to the RBPi to set SSH.

3. Install your new card into RBPi computer.

4. Connect RBPi 4B to monitor, mouse keyboard and power. (Skip to step 6 if you copied **SSH file to card**)

5. Boot Pi ==> Configure Pi ==> Go to Raspberry Pi Configuration ==> Interfaces ==> SSH enabled

Reboot. Wait a for the RBPi to complete boot on your network.

Record your Pi4B IP address to connect remotely through Putty on your PC or VSSH on your MAC

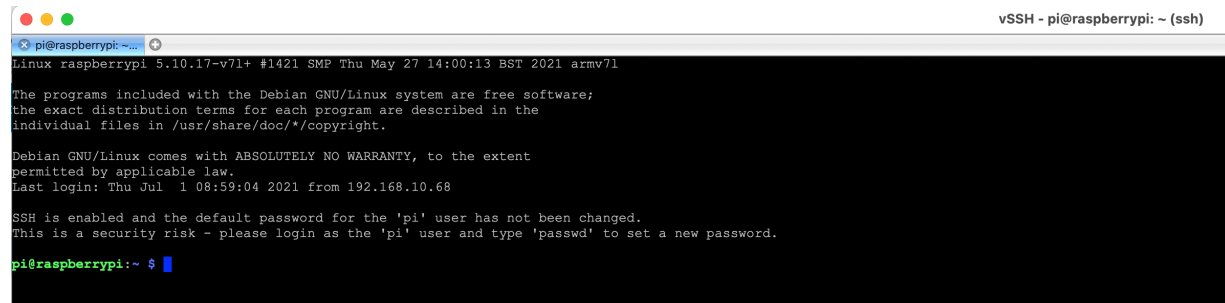

6. Connect remotely via VSSH on MAC. Connect to the correct IP address of the new Raspberry Pi4B on your network.

Use tools like Angry IP Scanner to find the Pi4B on your network.

A connected Pi4B boot should look like this on your remote SSH (MAC/PC) session.

From here you can **cut and paste actions** in the command line.

Commands are listed in green font from here on.

```
vSSH - pi@raspberrypi: ~ (ssh)
pi@raspberrypi: ~$
Linux raspberrypi 5.10.17-v7l+ #1421 SMP Thu May 27 14:00:13 BST 2021 armv7l

The programs included with the Debian GNU/Linux system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/copyright.

Debian GNU/Linux comes with ABSOLUTELY NO WARRANTY, to the extent
permitted by applicable law.
Last login: Thu Jul 1 08:59:04 2021 from 192.168.10.68

SSH is enabled and the default password for the 'pi' user has not been changed.
This is a security risk - please login as the 'pi' user and type 'passwd' to set a new password.

pi@raspberrypi:~ $
```

6. Update/upgrade your Raspberry Pi4B OS (will take a while).

Run these 3 commands via SSH. Note this will take a while:

```
sudo apt update
sudo apt full-upgrade
sudo reboot
```

```

pi@raspberrypi:~$ sudo apt update
Get:1 http://archive.raspberrypi.org/debian buster InRelease [32.6 kB]
Get:2 http://raspbian.raspberrypi.org/raspbian buster InRelease [15.0 kB]
Get:3 http://archive.raspberrypi.org/debian buster/main armhf Packages [375 kB]
Fetched 422 kB in 3s (135 kB/s)

Processing triggers for desktop-file-utils (0.23-4) ...
pi@raspberrypi:~$

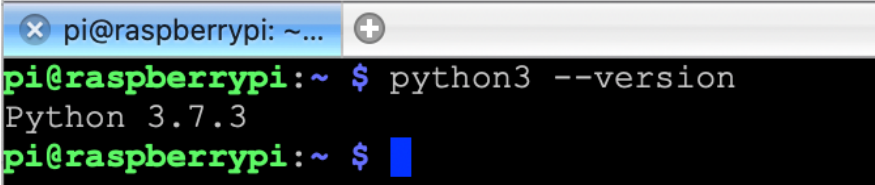

```

7. Install Python 3.7 via SSH command: With new RBPi O/S you can skip this step. Python 3.7.3 is included

```

sudo apt install python3
Check Python version
python3 --version
Should show: Python 3.7.3

```

```

pi@raspberrypi:~$ python3 --version
Python 3.7.3
pi@raspberrypi:~$

```

8. Set Pi to default to Python 3.7.3 With new RBPi O/S you can skip this step. Python 3.7.3 is included

See example: https://www.youtube.com/watch?v=_DI0jgnrDVc
 sudo nano ~/.bashrc (move cursor to bottom of code to paste command at the bottom)
 Paste: alias python='/usr/bin/python3' Ctl O , ENTER then Ctl X

```
Run: source ~/.bashrc
python --version
```

9. Install FFMPEG :

Solution B: See web page below
<https://snapcraft.io/install/ffmpeg/raspbian>

First:

```
sudo apt update
sudo apt install snapd
sudo reboot
```

Second:

```
sudo snap install core
sudo reboot
```

Third:

```
sudo snap install ffmpeg --classic (-minus,-
minus,classic)
```

Forth - Check version:

```
ffmpeg -version (-minus, version)
```

Standard Version installed:

```
ffmpeg version 4.1.6-1~deb10u1+rpt2 Copyright
(c) 2000-2020 the FFmpeg developers
built with gcc 8 (Raspbian 8.3.0-6+rpi1)
```

See this:

<https://lindevs.com/install-ffmpeg-on-raspberry-pi/>

Un-Install FFMPEG:

`sudo apt purge --autoremove -y ffmpeg (- , - , autoremove)`

```
pi@raspberrypi:~$ ffmpeg -version
ffmpeg version 4.1.3-ubuntu Copyright (c) 2000-2020 the FFmpeg developers
  built with gcc 8 (Raspbian 8.3.0-6+rpt1)
  configuration: --prefix=/usr --extra-version=1ubuntu1 --toolchain=hardened --libdir=/usr/lib --incdir=/usr/include/arm-linux-gnueabihf --enable-gpl --enable-lto --enable-libvpx --enable-libx264 --enable-libx265 --enable-libyasm --enable-libzimg --enable-libzmq --enable-libzvbi --enable-lv2 --enable-omx --enable-opencl --enable-openssl --enable-vaapi --enable-vulkan --enable-libfreetype --enable-libfontconfig --enable-libfribidi --enable-libgsm --enable-libjack --enable-libmp3lame --enable-libmysofa --enable-libopenjpeg --enable-libopus --enable-libpulse --enable-librav1e --enable-librtmp --enable-librubio --enable-libshine --enable-libsnappy --enable-libsoxr --enable-libspeex --enable-libsrt --enable-libssh --enable-libtheora --enable-libtwolame --enable-libvidstab --enable-libvorbis --enable-lv2 --enable-libwayland --enable-libwebp --enable-libxml2 --enable-libxvid --enable-libzmq --enable-libzimg --enable-omx --enable-opencl --enable-openssl --enable-vaapi --enable-vulkan --enable-libfreetype --enable-libfontconfig --enable-libfribidi --enable-libgsm --enable-libjack --enable-libmp3lame --enable-libmysofa --enable-libopenjpeg --enable-libopus --enable-libpulse --enable-librav1e --enable-librtmp --enable-librubio --enable-libshine --enable-libsnappy --enable-libsoxr --enable-libspeex --enable-libsrt --enable-libssh --enable-libtheora --enable-libtwolame --enable-libvidstab --enable-libvorbis --enable-lv2 --enable-libwayland --enable-libwebp --enable-libxml2 --enable-libxvid --enable-libzmq --enable-libzimg --enable-omx --enable-opencl --enable-openssl --enable-vaapi --enable-vulkan
  libavutil 58. 22.100 / 58. 22.100
  libavcodec 58. 35.100 / 58. 35.100
  libavdevice 58.  3.100 / 58.  3.100
  libavformat 58. 20.100 / 58. 20.100
  libavfilter  7. 40.101 /  7. 40.101
  libavresample 4.  0.  0 /  4.  0.  0
  libswscale  5.  3.100 /  5.  3.100
  libswresample 3.  3.100 /  3.  3.100
  libpostproc 55.  2.100 / 55.  2.100
pi@raspberrypi:~$
```

You can upgrade FFMPEG to most current version:
See: <https://ffmpeg.org/download.html>

Get the FFMPEG AP:

`git clone https://git.ffmpeg.org/ffmpeg.git ffmpeg`

10. Install netcat `sudo apt-get install mplayer netcat`

You have successfully generated a RBPi “basic image” for the Unifi-Cam-Proxy install.

Contains:

- Up to date RBPi O/S
- Python 3
- SSH turned on for remote installs and run through tools like Mac VSSH or PC Putty.
- ffmpeg
- Netcat

Basic Unifi_Cam_Proxy Image Complete (Steps 1-10)

If you were given permission to download the most current “basic-image” (about 6GB) through Drop-Box:

- Download “basic-image” to your computer.
- Download these instructions .PDF
- Go to step 1 and follow directions to burn “basic-image” to the 32GB card.

Use your new image downloaded and burned or created in steps 1-10.

Place card with new “basic image” into a RBPi computer and complete steps 11-20:

11. Generate client certificate on the Pi root directory by running command (Cut and paste all of this command in to the **command line below** and press enter on the last line to run)

```
openssl ecparam -out /tmp/private.key -name prime256v1 -genkey -noout
openssl req -new -sha256 -key /tmp/private.key -out /tmp/server.csr -subj "/
C=TW/L=Taipei/O=Ubiquiti Networks Inc./OU=devint/CN=camera.ubnt.dev/
emailAddress=support@ubnt.com"
openssl x509 -req -sha256 -days 36500 -in /tmp/server.csr -signkey /tmp/
private.key -out /tmp/public.key
cat /tmp/private.key /tmp/public.key > client.pem
rm -f /tmp/private.key /tmp/public.key /tmp/server.csr
```

dir or ls

After these commands run type **DIR** and you see that a **client.pem** file is generated on the Pi4B

```
vSSH - pi@raspberrypi: ~ (ssh)
pi@raspberrypi:~$ openssl ecparam -out /tmp/private.key -name prime256v1 -genkey -noout
pi@raspberrypi:~$ openssl req -new -sha256 -key /tmp/private.key -out /tmp/server.csr -subj "/C=TW/L=Taipei/O=Ubiquiti Networks Inc./OU=devint/CN=camera.ubnt.dev/emailAddress=support@ubnt.com"
pi@raspberrypi:~$ openssl x509 -req -sha256 -days 36500 -in /tmp/server.csr -signkey /tmp/private.key -out /tmp/public.key
Signature OK
Subject=C = TW, L = Taipei, O = Ubiquiti Networks Inc., OU = devint, CN = camera.ubnt.dev, emailAddress = support@ubnt.com
Getting Private Key
pi@raspberrypi:~$ cat /tmp/private.key /tmp/public.key > client.pem
pi@raspberrypi:~$ rm -f /tmp/private.key /tmp/public.key /tmp/server.csr
pi@raspberrypi:~$
pi@raspberrypi:~$
pi@raspberrypi:~$ dir
Bookshelf client.pem Desktop Documents Downloads Music Pictures Public Templates Videos
pi@raspberrypi:~$
```

12. Generate a token to be used on the UDMP or UNVR.
(Not needed **right now** for final Unifi_Cam_Proxy compile)

This is different directions than listed on unifi-cam-proxy Github page.

sudo reboot before step 13

Do an update prior to unify-cm-proxy install:

```
sudo apt update
sudo apt full-upgrade
sudo reboot
```

Go to Unifi Protect user interface on your computer (you must have login rights).

A. On the Protect UI, Click Devices (**upper left corner icon**) Then click 'Add Devices' in the **upper right corner** then click Find More Devices **bottom left corner**.

There will be a “pop-up box” selection of Unifi cameras.

Select 'G3 Micro'.
 Select 'Continue on Web' and type in a random string for the SSID and Password fields and click 'Generate QR Code'

B. With the AP **De-Barcode** loaded on your phone scan the barcode.

Raw data will appear on the screen

Click Copy to pasteboard button

From your phone email the content to your desktop computer.

Open your desktop computer email.

Copy the second to last line of characters that look something like this: ABC3fQQQQQQQQQQQQQ8XYZKWHoK

Record this list of characters for use later as your Token.

13. Now you are ready to install Unifi-Cam-Proxy on your Raspberry Pi 4B

9-6-21: Pre released changes use:

pip3 install git+https://github.com/keshavdv/unifi-cam-proxy.git

pip3 install unifi-cam-proxy (This will install UniFi-cam-proxy but does not include any of the most recent changes – use above format)

```

pi@raspberrypi:~$ pip3 install unifi-cam-proxy

pi@raspberrypi:~$

```

Above looks like a successful install.

Reboot RBPi:

`sudo reboot`

Unifi-Cam-Proxy Updates and Version Check if you have problems:

On occasion the Proxy firmware is updated.

If you want or need to update your current version run this command:

`pip3 install --upgrade unifi-cam-proxy`

then `sudo reboot`

Check Version of Unifi-cam-proxy:

`unified-cam-proxy -version (-minus,minus,version)`

Should show **0.1.4** or higher

FFMPEG Version Check if you have problems:

`ffmpeg -version`

Should be greater than 4.1.6.1 ==> or something like this:

```
pi@raspberrypi:~$ ffmpeg -version
ffmpeg version bf87bdd Copyright (c) 2000-2021 the FFmpeg developers
built with gcc 8 (Raspbian 8.3.0-6+rpt1)
configuration: --extra-flags=-I/usr/local/include --extra-ldflags=-L/usr/local/lib --extra-libs='-lpthread -lm -latomic' --arch=armel --enable-gmp --enable-gpl --enable-libaom
--enable-libbrotli --enable-libdav1d --enable-libfdk_aac --enable-libfreetype --enable-libgsm --enable-libjvarkit --enable-liblame --enable-liblibvpx --enable-libltp --enable-libopus --enable-librtmp
--enable-libsnappy --enable-libsoxr --enable-libtesseract --enable-libtheora --enable-libvorbis --enable-libvpx --enable-libx264 --enable-libx265 --enable-libxvid --enable-nonfree --enable-omx
--enable-omx-rpi --enable-version3 --target-os=linux --enable-pthreads --enable-op
libavutil 56. 70.100 / 56. 70.100
libavcodec 58.134.100 / 58.134.100
libavformat 58. 76.100 / 58. 76.100
libavdevice 58. 13.100 / 58. 13.100
libavfilter 7.110.100 / 7.110.100
libswscale 5. 9.100 / 5. 9.100
libswresample 3. 9.100 / 3. 9.100
libpostproc 55. 9.100 / 55. 9.100
```

Run:

`# RTSP stream`

After this you can run the BigBuckBunny test or your specific camera command line

from here. **OPTIONAL**
Pi4B must be running the unify-cam-proxy at all times on your camera network to serve the proxy tokens for your non-Unifi cameras.

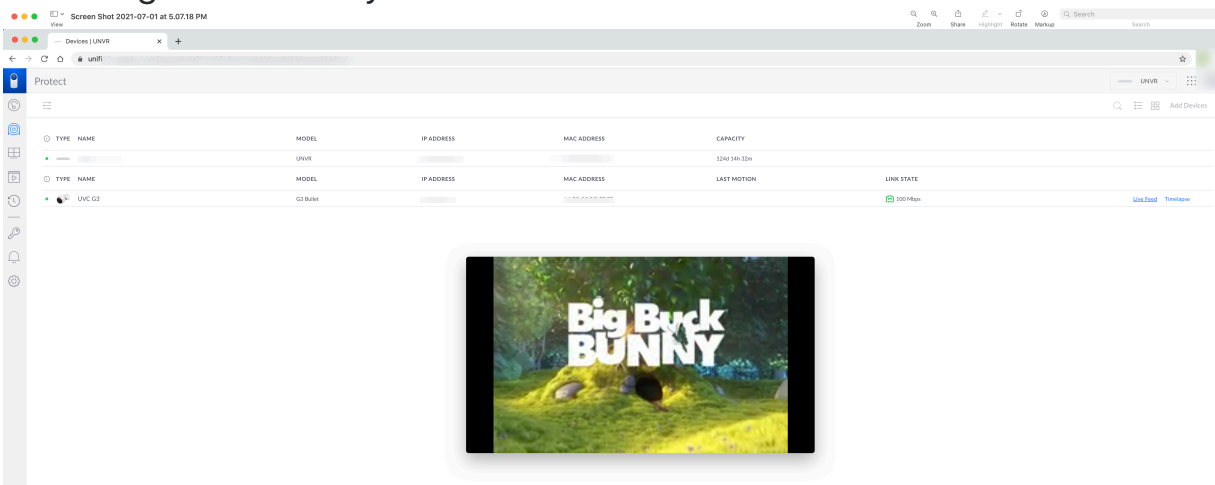

14. Test your Pi4B OS and unify-cam-proxy install with BigBuckBunny video.

192.168.XX.YYY is the IP address of of your UNVR or UDMP

ABC3f3nAFPX123FISpZmFSJ8XYZKWHoK is your Token you generated. zsTGLfSbOIX5kIS3yGiedYDQYhXoQ95H
unifi-cam-proxy --host 192.168.XX.YYY --cert client.pem --token ABQQQQQQQQQQQQQQQQQQQQQQQQQQK rtsp -s rtsp://wowzaec2demo.streamlock.net/vod/mp4:BigBuckBunny_175k.mov

After this code is running on your Pi4B go to the Unifi Protect under interface

A camera UVC3G with IP address of 192.168.1.10 will be running the Bunny movie. Click Live Feed to see it.

Control+Z to stop the Bunny Video.

15. Run the HiKVision camera (other commands for your specific camera)

192.168.19.163 is the IP address of your UNVR or UDMP

192.168.19.94 is the IP address of your camera

user name of camera: admin

Password of camera: 9Wodda!

```
unifi-cam-proxy -H 192.168.19.163 -i 192.168.19.64 -c  
client.pem -t 1234lvnKnAGVe6AbIXmfDOWE1wD4ABCD  
hikvision -u admin -p 9Wodda!
```

Open up the UDMP user interface to view Live Stream for the new camera added.

16. From power off:

```
unifi-cam-proxy -H 192.168.10.153 -i 192.168.10.64 -c  
client.pem -t 123zlvnKnAGVe6AbIXmfDOWE1wDABCD  
hikvision -u admin -p 9Wodda!
```

If you get command line fail – generate a new token goto step 10.

```
unifi-cam-proxy -H 192.168.10.153 -i 192.168.10.64 -c  
client.pem -t 123xSH3OGqS9ABCi9QhE1a9vm333Yz8R  
hikvision -u admin -p 9Wodda!
```

Run: `source ~/.bashrc`

17. Run `python --version`

Run update for current Unifi Proxi software:

```
pip3 install --upgrade unifi-cam-proxy
```

```
sudo reboot
```

18. Backup your card to an image file

OPTIONAL

Example for help: <https://www.youtube.com/watch?v=Nc3YyANoOeQ>

Pull card from Pi. Plug card into adapter. Plug into MAC. Once card sees BOOT image use Disk Utility Tools to find out what DRIVE # it is IE: 4
Change the drive number below from 1 to drive number of BOOT disk. This process to create an image will take some time.

Run this command in the MAC terminal:

```
sudo dd if=/dev/disk4 of=~ /Desktop/PiSDCardBackup.dmg
```

19. Burn new card with IMAGE backup. Use Etcher 2

20 Auto Run Unifi-Cam-Proxi when your Pi boots.

OPTIONAL

Example for help: <http?s://www.youtube.com/watch?v=RFyqi5Utcqw>

Boot Pi

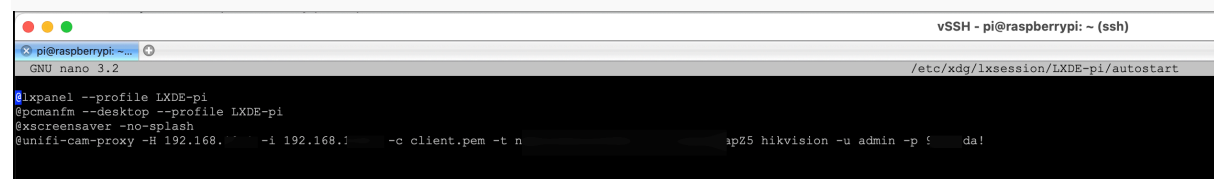

Run : `sudo nano /etc/xdg/lxsession/LXDE-pi/autostart`

Add on the last line you command line for to run your Unifi-Cam-Proxy command:

```
@unifi-cam-proxy -H 192.168.XX.Y -i 192.168.XX.ZZ -c client.pem -t nQQQQQQQQQQQQQQQQQQQQQpZ5 hikvision -u admin -p PPPPPa!
```

Control-O / Control-Z (Updates your lxsession boot file

Sudo Reboot

```
vSSH - pi@raspberrypi: ~ (ssh)
pi@raspberrypi: ~
GNU nano 3.2 /etc/xdg/lxsession/LXDE-pi/autostart
!lxpanel --profile LXDE-pi
!pcmanfm --desktop --profile LXDE-pi
!xscreensaver --no-splash
@unifi-cam-proxy -H 192.168.1.1 -i 192.168.1.1 -c client.pem -t n
apZ5 hikvision -u admin -p ! da!
```

21. Add Docker to Raspberry Pi Image:

See <https://phoenixnap.com/kb/docker-on-raspberry-pi>

Make sure image is updated:

```
sudo apt-get update && sudo apt-get upgrade
```

```
curl -fsSL https://get.docker.com -o get-docker.sh
```

```
sudo sh get-docker.sh
```

Add a root:

```
sudo usermod -aG docker pi
```

```
docker version
```

```
docker info
```

File Backup Version Dates:

8-23-21 Made Pi image for backup called:

Unifi_Cam_Proxy8_23_21Private

Unifi_Cam_Proxy8_23_21Public

Private version includes my Private .PEM
Keys

Public Version the .PEM key is removed.

Unifi-Cam-Proxy Version 0.1.4

FFMPEG :ffmpeg version 4.1.6-1~deb10u1+rpt2

Copyright (c) 2000-2020 the FFmpeg developers
built with gcc 8 (Raspbian 8.3.0-6+rpi1)

Notes: All Hikvision cameras work great!

Runs the Big Buck Bunny Video

Tested on Unifi Protect 1.18.1 and 1.19.0
on UNVR and UDMP

Camera Tested:
